The Technics HE+ filter is made of two pleated and perforated cardboard walls glued by their edges with an additional thin layer of polyester on the rear face.

The Technics HE+ filter combines the field proven inertia separation principle of the Technics standard and the filtration capabilities of the polyester fibre. The result : a superior holding capacity and an exceptional filtration efficiency to capture any type of liquid overspray.

The holding pockets retain the paint particles outside the airstream and the polyester captures the remaining over spray. Due to this unique combination, the static pressure remains constant during the loading phase and the Technics HE+ filter lasts 4 to 6 times longer than fibre-glass filters with a higher efficiency.

STANDARD DIMENSIONS:

- ◆ 900m High x 8 mtrs
